

Canton Names

Readable names for Canton party IDs

The Problem

On Canton, sending value still depends on **long opaque party IDs** that are easy to mistype and hard to trust.

One wrong character → transfer fails or wrong recipient

The Solution

Canton Names turns party IDs into readable names like `alice.unverified.cns`

Drop-in recipient field that:

- Resolves the name to the right party
- Warns before sending if missing, expired, or unverified

RECIPIENT

alice::1220a3f9b8c4d5e6f7a8b9c0d1e2...

alice.unverified.cns ✓ Resolved

⚠ Expired — name no longer valid

✗ Not found — check spelling

ℹ Unverified — not identity-checked

Who It's For

Canton app teams building:

- Wallets
- Payments
- Settlement
- Transfer flows

Any app where users send value to counterparties.

Proof

Recipient Component

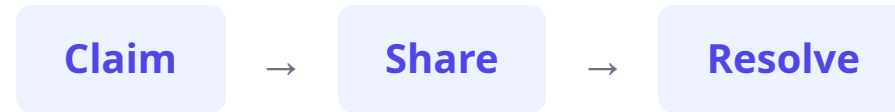

Drop-in resolver demo

Demo Mode

Runs locally, fully functional

55 passing tests. Clean build.

Demo

In the demo, we claim a name, share it, and then resolve it inside a mock transfer flow with safety checks.

How We Make Money

Revenue model (planned)

Verified names for institutions

Organizations pay for identity-verified names (e.g. `bank.cns`). Fits Canton's regulated user base.

Paid resolver tiers

Free component; paid SLAs for wallets, exchanges, custodians.

Name fees + network rewards

Annual renewal fees. On-chain activity may earn Canton app rewards.

Ecosystem grants

Canton Foundation / AppsFactory funding to reach paid tiers.

Revenue model is a plan; nothing is live yet.

The Ask

- 1 DevNet or TestNet access
- 2 One Canton app team willing to pilot

Prove readable names work in real transfers.
